# Final Project Report

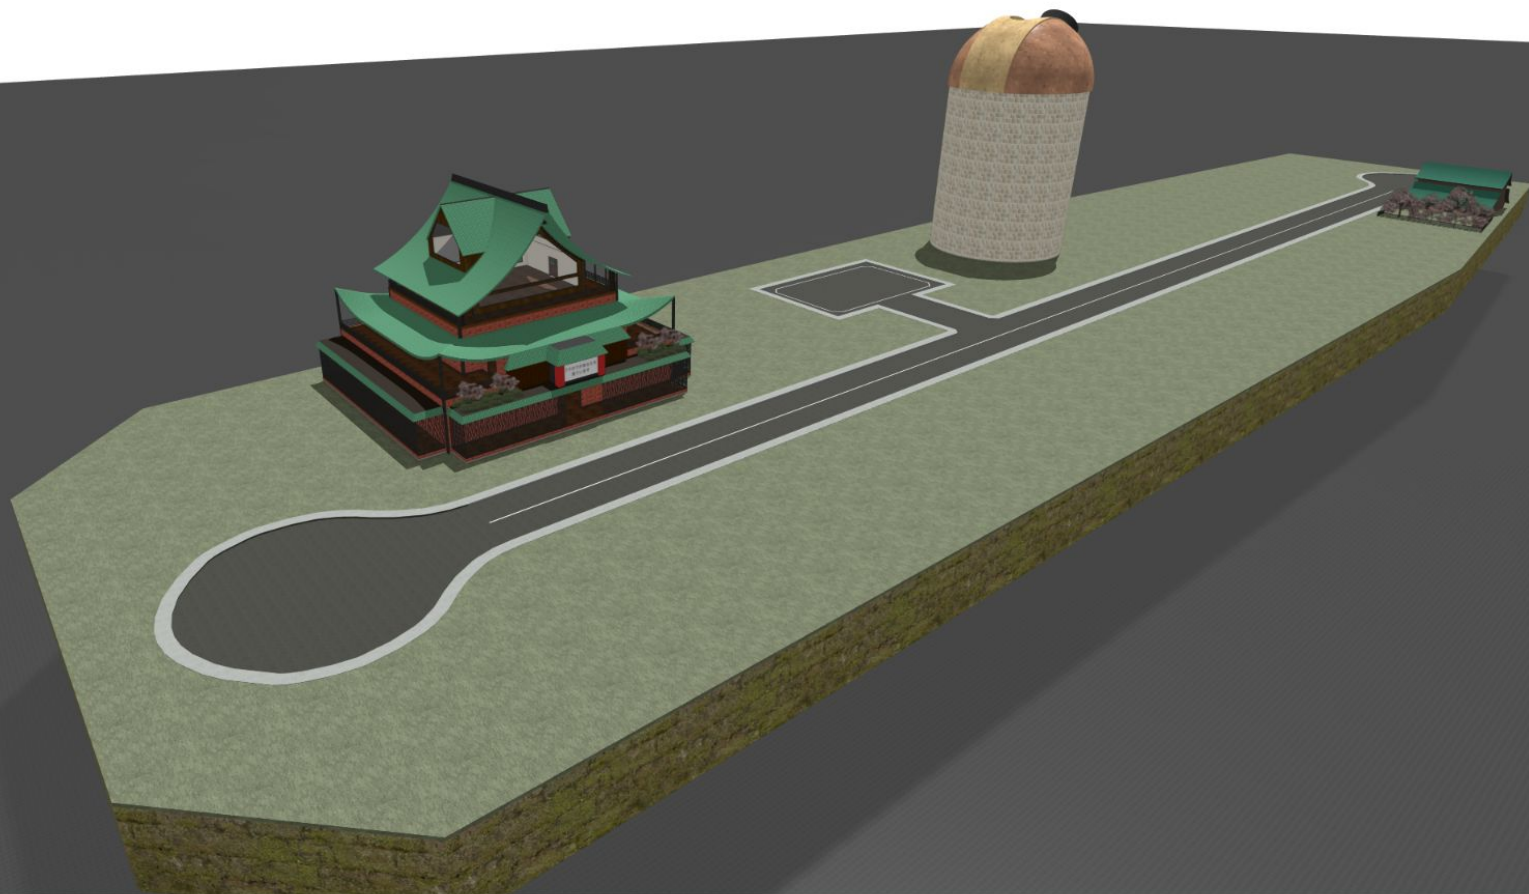

I initially wanted my final project to be a small town floating on an aircraft carrier-like boat. However, filling the space on the boat turned out to be harder than I anticipated, so I shifted my focus to one main building. This building (and one other on the island) was heavily inspired by Japanese architecture, with a pagoda-style roof over a wrap-around porch and a large curved over the center section. The boat also includes a large observation tower, inspired by a sort of “medieval technology” style. Although my main goal of a town on a boat is unfinished, the main building turned out very well and was what I chose to build a physical model of.

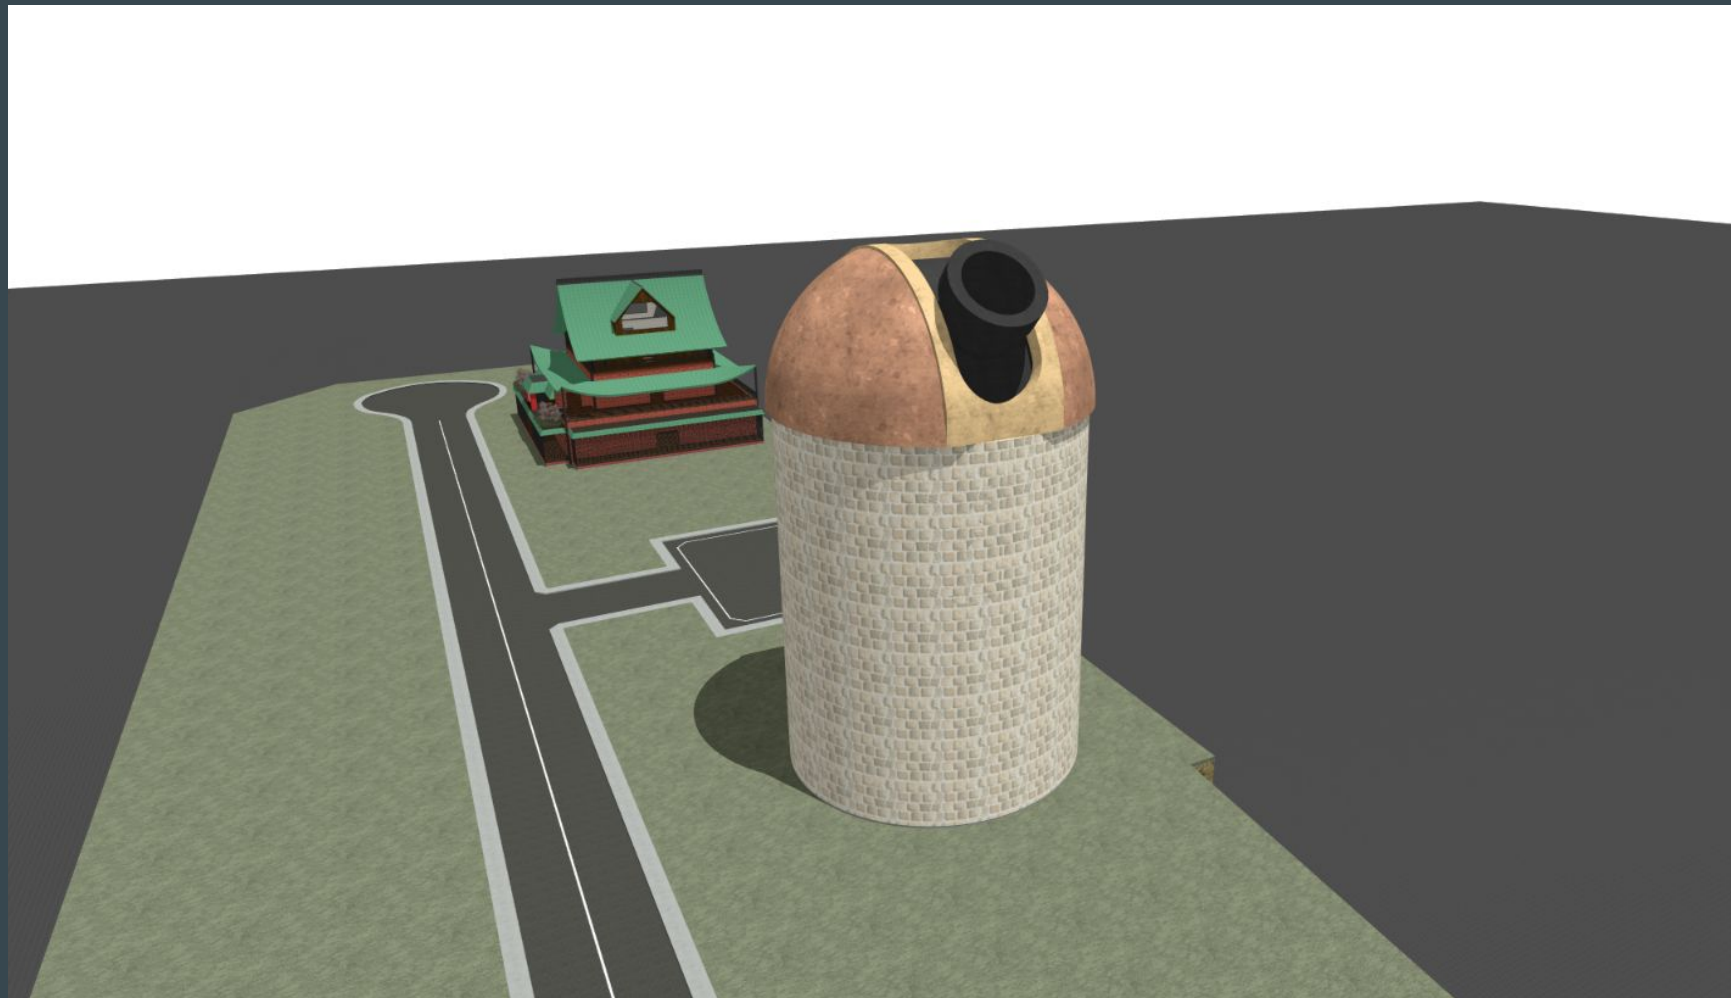

The main inspiration for the main building was a Japanese bathhouse, which could be part of its function. However, the building could also function as a meeting hall for the residents of the boat-town, or a community center with library and other leisure areas.
